

ABSTRACT OF THE DISCLOSURE

A system for intermediating selling and purchasing goods and/or services using a network to which a purchaser terminal that transmits offer information including offer conditions from a purchaser and a seller terminal that transmits sales information including sales conditions from a seller are connected. A sales information registering unit registers the sales conditions and a sales information search unit searches, in the sales information registering unit, the sales conditions matching with the offer conditions and outputs a purchasing result to the purchaser terminal. An offer information registering unit registers the offer conditions when the purchasing result indicates that either the sales conditions match with the offer conditions and a notice from the purchaser indicates non-agreement to the purchasing result, or the sales conditions do not match with the offer conditions. Further, the registering unit registers the offer conditions as a registration information when the purchasing result indicates that the sales conditions match with the offer conditions and a notice from the purchaser indicates agreement to the purchasing result. An offer information search unit receives the sales conditions, searches in the offer information registration unit the offer conditions matching the sales conditions, collects the offer conditions matching the sales conditions, and transmits a sales result to the seller terminal and allows a seller to accept or decline the sales result. A reservation unit registers the search result from the sales information search unit and the offer conditions.
